

Class 16: Structural Induction

Schedule

Problem Set 6 is due **tomorrow at 6:29pm**. Make sure to read the corrected version of Problem 7.

Lists

Definition. A *list* is an ordered sequence of objects. A list is either the empty list (λ), or the result of $\text{prepend}(e, l)$ for some object e and list l .

$$\begin{aligned}\text{first}(\text{prepend}(e, l)) &= e \\ \text{rest}(\text{prepend}(e, l)) &= l \\ \text{empty}(\text{prepend}(e, l)) &= \mathbf{False} \\ \text{empty}(\mathbf{null}) &= \mathbf{True}\end{aligned}$$

Definition. The *length* of a list, p , is:

$$\begin{cases} 0 & \text{if } p \text{ is } \mathbf{null} \\ \text{length}(q) + 1 & \text{otherwise } p = \text{prepend}(e, q) \text{ for some object } e \text{ and some list } q \end{cases}$$

```
def list_length(l):  
    if list_empty(l):  
        return 0  
    else:  
        return 1 + list_length(list_rest(l))
```

Prove: for all lists, p , $\text{list_length}(p)$ returns the length of the list p .

Concatenation

Definition. The *concatenation* of two lists, $p = (p_1, p_2, \dots, p_n)$ and $q = (q_1, q_2, \dots, q_m)$ is

$$(p_1, p_2, \dots, p_n, q_1, q_2, \dots, q_m).$$

Provide a *constructive* definition of *concatenation*.

Structural Induction

To prove proposition $P(x)$ for element $x \in D$ where D is a recursively-constructed data type, we do two things:

1. Show $P(x)$ is true for all $x \in D$ that are defined using base cases.
2. Show that if $P(y)$ is true for element y and x is constructed from y using any “construct case” rules, then $P(x)$ is true as well.

Comparing Various forms of Induction

	Regular Induction	Invariant Principle	Structural Induction
Works on:	natural numbers	state machines	data types
To prove $P(\cdot)$	<i>for all natural numbers</i>	<i>for all reachable states</i>	<i>for all data type objects</i>
Prove base case(s)	$P(0)$	$P(q_0)$	$P(\text{base object(s)})$
and inductive step	$\forall m \in \mathbb{N}.$	$\forall (q, r) \in G.$	$\forall s \in \text{Type}.$
	$P(m) \implies P(m+1)$	$P(q) \implies P(r)$	$P(s) \implies P(t)$
			$\forall t \text{ constructable from } s$

Prove. For any two lists, p and q , $\text{length}(p + q) = \text{length}(p) + \text{length}(q)$.
